sample, and the normal level of expression of the marker in a conf-cervical cancer sample, where a significant increase in the levenexpression of the marker in the patient's sample relative to that control sample is an indication that the patient is afflicted with cervical cancer. (I) has cytostatic activity, and can be used in the therapy and in vaccines. (I) is useful in detecting, characterising preventing and treating human cervical cancers. (I) may also be useful in detecting.

invention This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory, ophthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for diagnosing or treating a hypoxia-regulated condition, such as tumourigenesis, angiogenesis, apoptosis, inflammation, erythropoiesis, or the biological response to hypoxia conditions Claim 27; SEQ ID NO 118; 424pp; English.

usion

a compound capable of treating a metabolic disorder comprises r compounds that modulate matrix metalloprotease MMP-12 Claim 4; SEQ ID NO 1; 38pp; English. expression or activity Identifying a assaying for

The invention describes a method of identifying a compound capable of treating a metabolic disorder comprising assaying the ability of the compound to modulate a matrix metalloproteinase 12 (MMP-12) nucleic acid expression or MMP-12 polypeptide activity. The compound has anoretic, antidiabetic and immunomodulator properties. An antisense oligonucleotide or ribozyme targets the MMP-12 transcripts and inhibits translation. Alternatrively the oligonucleotide forms a triple helix with the promoter

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for treating or preventing microbial infections by the administration of MMPAP-12 nucleic acids encoded polypeptides thereof. Specifically MMPAP-12, also referred to MMP-12, refers to matrix metalloproteinase-12 and is a member of the family of matrix degrading enzymes capable of matrix destruction and hence contributes to such diseases as emphysema and aortic aneurysm. present invention, however, describes the unexpected non-enzymatic, antimicrobial properties of the MMP-12 protein at the cellular level. such, MMP-12 nucleic acids, proteins and fragments thereof, have been identified that exhibit specific activities which are useful for the treatment of infectious diseases associated with microorganisms, bacteria, virus, fungi or parasites such as pneumonia or peritonitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             level.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for predicting, diagnosing or prognosing chronic lung disease by detecting a chronic obstructive pulmonary disease (COPD) gene related polynucleotide (see ACC46750 to ACC46777, which encode the COPD related proteins in ABP96779 to ABP96806). The method is useful for predicting, diagnosing or prognosing chronic lung disease in a biological sample. The COPD genes and proteins encoded by them from the present invention (I) can be used for treating or preventing chronic lung disease in a mammal. (I) can be used in an animal model for determining the efficacy, toxicity, or side effects of treatment with (I), and determining the mechanism of action of (I).

ACC46778 to ACC46903 represent COPD related PCR primers and probes used in an example from the present invention
                                                                                                                                                                                                                                                                        disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease, by detecting a in a biological sample

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel pharmaceutical composition, which first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking region initiation codon, coding region, or regions within 2-10 nucleotide junctions of genes encoding a polypeptide associated with lung and nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invense in antisense gene therapy. The composition of the invense in antisense gene therapy. The composition is useful for treat preventing a respiratory, lung or malignant disease or condition, for enhancing the prophylactic or therapeutic respiratory effect o antiinflammatory steroid in a subject, for reducing or depleting 1 of, or reducing bronchodilation, increasing levels of ubiquino receptor, producing bronchodilation, increasing levels of ubiquino lung surfactant in a subject's tissue, or treating bronchoconstric lung inflammation, lung allergies, or a respiratory disease or con Note: The sequence data for this patent is not represented in the specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating ailments associated with respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid sterubiquinone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 1778;

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and bronchoconstruction, respiratory tract inflammation, allergies and bronchoconstruction, respiratory tract inflammation, allergies and ceducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating distribution or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antinflammatory, antiashmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or maligant disease. The administered to reduce the amount of the target mRNA or to composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or bronchoconstriction and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies, asthma, impeded respiration, respiratory distress byndrome, pain, cystic fibrosis, allergic rhinitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the inflammation methods and pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into product that the benisonent and thereby, to it the oligonucleotides into product the transplantation rejection, pulmonary t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides (ADI53690-ADI53701) for matrix metalloproteinase 12 (MMP-12; ADI53688 and ADI53689), which specifically hybridise with the nucleic acid encoding MMP-12 and inhibiting the translation of MMP-12 protein. The antisense oligonucleotides are useful for preparing a composition for treating or preventing MMP-12 dependent disorder in a human patient e.g. inflammatory bowel disease, such as ulcerative colitis and Crohn's disease, rheumatoid arthritis, psoriasis, emphysema or asthma.

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.

                                                                                                    ø
                                                                                                                                      The invention comprises a method for diagnosing colon cancer in individual, the method involves obtaining a serum sample from tindividual and detecting the presence of either TIMP1 or Reg1-a an additional colorectal cancer-associated marker. The method of invention is useful for diagnosing colon cancer in an individual present DNA sequence represents a human colorectal cancer-associatein coding sequence of the invention.
                                                                                          Diagnosing colon cancer in individual, preferably human, by deteresence of TIMP 1 in sample, where presence of TIMP 1 in sample indicative of colon cancer in individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      canc

(I) and (II) have cytostatic activity and can be used in gene therapy and vaccines. (I), (II), antibodies and compositions from the present invention are useful for diagnosing, preventing and treating cancer, which expresses CT or CP mRNA antigens. They are useful for stimulating immune response. They can also be useful in virology, immunology, microbiology, molecular biology and recombinant DNA techniques. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA
according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in

Novel human macrophage metalloelastase polynucleotides and polypeptides useful for measuring elastin degradation.
                                                                                                     macrophage metalloproteinase; elastin; matrix degrading enzyme;
                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides the coding and protein sequences human macrophage metalloelastase. This is a matrix degrading metalloproteinase which has the ability to degrade elastin, and used to measure elastin degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       563 A; 365 C; 350 G; 540 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                          tissue sarcoma
n individual
                                                                                                                                      The invention relates to a novel method for detecting soft tissue sarcomination value tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB4339 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antiathmatic; antiatheumatic; antiathritic; antiathritic; antiathmatic; antiathritic; antiathmatic; antiathritic; antiathritic; antiathmatic; antiathritic; antiathritic; coagulator; cascing and polypeptide; and antiangiogenic. The nootropic; vasotropic; antipsoriatic and antiangiogenic. The present invention may be used for preventing, treating or polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autolumnne cejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and cardiovascular disorders, neurological disease and AAB4857 and AAB4840 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

is a high useful for or graft equence the printed directly from USPTO or more theThe invention relates to a combination comprising cDNAs that are differentially expressed in dendritic cells (DC). Also included is throughput method for detecting differential expression of one or cDNAs in a sample containing nucleic acids. The combination is use preparing a composition for diagnosing, treating and monitoring the treatment of cancer, infectious disease, autoimmunity, allergy or versus host disease, or for enhancing a vaccine. The present seque represents a human cDNA upregulated in dendritic cells. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from at sequence.uspto.gov/sequence.html?DocID=20030134283.

determining the polypeptide or polynucleotide, in a sample from a subject, where a higher subject free of cancer is indicative of lagnosing cancer comprises cevels e.g., hepatic lipase, evel compared to that in a s Diagnosing ca levels e.g.,

272pp; English. 288; Disclosure; SEQ ID NO

subject, of the free any t 0 in theThe invention relates to a novel method for diagnosing a cancer i subject. the method comprises determining, in a sample from the sthe level of at least one polypeptide, where a higher level of the polypeptide in a subject polypeptide compared to the level of the polypeptide in a subject cancer is indicative of cancer. The polypeptide is selected from the polypeptides encoded by the polynucleotides listed in the specification and polypeptides which are at least 70% homologous

invention polypeptides. The method of the invention has cytostatic activity, and may have a use in gene therapy. The method is useful in identifying markers specific for one or several types of cancer, depending on the tissue origin, which may be used in numerous diagnostic and prognostic applications as well as cancer type-specific targets for therapeutic intervention. The compounds that modulate the activity of a tumour suppressor gene are useful in the treatment of cancer or as anti-cancer drugs. The present sequence represents a polynucleotide of the invention

2000-205971/18 WPI; New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers

English Page 1018-1020; 1343pp; Disclosure;

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive

ot trigger cancers not adenosine (A) content antisense oligonucleotides which do nadenosine receptors during metabolism, useful e.g. for treating and respiratory obstructions.

Page 1096-1098; 1592pp; English

ive base The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antise oligonucleotides the A is replaced by a 'Universal' or alternative l

immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cotoxine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide receptors, binding proteins, growth factors, vasociated proteins. The receptors, binding proteins and malignancy associated proteins. The receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy (ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), palinonary transplantation rejection, pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and antisense oligonucleotides used in the exemplification of the process. and/or present invention the

Disclosure; SEQ ID NO 12113; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, stissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-09-949-016-5005/c

US-09-949-016-5005/c

Sequence 5005, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USE

FILE REFERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 1410;

GENERAL 196A-3451/c
; Sequence 3451, Application US/09248796A
; Sequence 3451, Application US/09248796A
; Patent No. 6747137
; GENERAL INFORMATION:
; APPLICANT: Keith Weinstock et al
; TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
; TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
; TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
; FILE REFERENCE: 107196.132
; CURRENT APPLICATION NUMBER: US 60/074,725
; PRIOR APPLICATION NUMBER: US 60/096,409
; PRIOR APPLICATION NUMBER: US 60/096,409
; PRIOR FILING DATE: 1998-08-13
; NUMBER OF SEQ ID NOS: 28208
; SEQ ID NO 3451
                                                                                                                                                                                                                                                             RESULT 4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 14
US-09-615-192A-357
; Sequence 357, Application US/09615192A
; Patent No. 6410718
; GENERAL INFORMATION:
; APPLICANT: Bloksberg, Leonard N.
; APPLICANT: Havukkala, Ilkka
; TITLE OF INVENTION: Materials and Methods for the
; TITLE OF INVENTION: Modification of Plant Lignin Content
; FILE REFERENCE: 11000.1003c4U
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length
Sequence 17416, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF FILE REFERENCE: CLO01307
CURRENT APPLICATION NUMBER: US/09/949,016
CURRENT FILING DATE: 2000-04-14
PRIOR FILING DATE: 2000-10-20
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-09-08
NUMBER OF SEQ ID NOS: 207012
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 17416
LENGTH: 51161
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

i Sequence 160756, Application US/09949016

patent No. 6812339

j GENERAL INFORMATION:

i TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES

FILE REFERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: FastSEQ for Windows Version 4.0

LEMANT. 60756

Sequence 1, Application US/08467963C
Sequence 1, Application US/08467963C
Patent No. 5968776
GENERAL INFORMATION:
APPLICANT: KLEIN, Michel H
APPLICANT: EWASYSHYN, Mary E
TITLE OF INVENTION: MULTIMERIC HYBRID GENE ENCODING A
TITLE OF INVENTION: CHIMERIC PROTEIN WHICH CONFERS PROTECTION AGAINST
TITLE OF INVENTION: PARAINFLUENZA VIRUS AND RESPIRATORY SYNCYTIAL VIRUS
NUMBER OF SEQUENCES: 38
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Sequence 3700, Application US/09710279

Patent No. 6703492

GENERAL INFORMATION:
APPLICANT: KIMMERLY, WILLIAM JOHN

TITLE OF INVENTION: STAPHYLOCOCCUS EPIDERMIDIS NUCLEIC ACIDS AND PROTEINS
FILE REFERENCE: PU3480US

CURRENT APPLICATION NUMBER: US/09/710,279

CURRENT FILING DATE: 2000-11-09

PRIOR APPLICATION NUMBER: 60/164,258

PRIOR FILING DATE: 1999-11-09

NUMBER OF SEQ ID NOS: 4472

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 3700

LENGTH: 3272
                                                                                          Sequence 7, Application US/09174937

Sequence 7, Application US/09174937

Patent No. 6756212

GENERAL INFORMATION:
APPLICANT: Khodadoust, Mehran
TITLE OF INVENTION: Isolated Proteins and Nucleic Acid Molecules Having
TITLE OF INVENTION: Homology to NIP2 Proteins and Uses Thereof
FILE REFERENCE: mni061
CURRENT APPLICATION NUMBER: US/09/174,937

CURRENT FILING DATE: 1998-10-19

NUMBER OF SEQ ID NOS: 9

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 7

arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.

Puring sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL; Sw:, SWISSPROT; Tr: TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/FOCjects/Celegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.chori.org/bacpac/home.htm

This sequence was finished as follows unless otherwise noted:

all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by sequence
from more than one subclone; and the assembly was confirmed by restriction digest.

## MAPPING INFORMATION:

and The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu STB/CHR7 , send or see http://genome.wustl.edu

## INFORMATION:

See: U-J. from Clone CTA-348C20 is from a release of the human BAC library CITB-HS-A. The library contains cloned DNA from human sperm. Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); Kim et al., Genomics 34:213-8 (1996). The clone is available Research Genetics, Inc. (http://www.resgen.com). SOURCE Clone C

<1. .31435
/ note="this sequence is not the entire insert of clone RP41-57J19; clone overlaps with GenBank Accession Number AC092758 (nucleotides 123789-171690) clone RP41-22J16
(center project name ccj); this annotated segment represents overlap with nucleotides 140269-171690 of AC092758" was confirmed This sequence was finished as follows unless otherwise noted: all regions were double-stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed. CLONE LENGTH: This sequence represents the entire insert of this clone unless otherwise noted. If there are overlapping clones, the overlaps are noted in the beginning and end of the Features section. misc feature

NOTE: This is a 'working draft' sequence. It currently consists of 23 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will.
                                                                                                                                                                                                    Sequencing vector: M13; 74%
Sequencing vector: M13; 74%
Sequencing vector: plasmid; 21%
Chemistry: Dye-primer ET; 74% of reads
Chemistry: Dye-terminator Big Dye; 21% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 125167 bases at least Q40
Consensus quality: 136167 bases at least Q20
Consensus quality: 134105 bases at least Q20
Insert size: 106000; agarose-fp
Insert size: 139359; sum-of-contigs
Quality coverage: 4.05 in Q20 bases; sum-of-contigs
Quality coverage: 3.14 in Q20 bases; sum-of-contigs
